Title Sequence Error Filter for Formalin-Fixed and Paraffin-Embedded Samples

Version 2.1.6

Maintainer Masachika Ikegami <ikegamitky@gmail.com>

Description Clinical sequencing of tumor is usually performed on formalin-fixed and paraffin-embedded samples and have many sequencing errors. We found that the majority of these errors are detected in chimeric read caused by single-strand DNA with micro-homology. Our filtering pipeline focuses on the uneven distribution of the artifacts in each read and removes such errors in formalin-fixed and paraffin-embedded samples without over-eliminating the true mutations detected in fresh frozen samples.

exampleBam	<i>An example BAM file.</i>
------------	-----------------------------

Description

A BAM file containing the information of eight mutations.

Usage

exampleBam

Format

A list with 8 factors, each contains 46527 variables:

rname chromosome of the read

qname read ID list

seq sequence of the read, in DNASring

strand strand of the read

cigar CIGAR sequence of the read

qual Phred quality of the read

pos starting position of the read

isize insert size of the read ...

exampleMutation *An example mutation file.*

Description

A dataset containing the information of eight mutations.

Usage

exampleMutation

Format

A list with 8 factors, each contains 29 variables

Sample sample name

Mut_type mutation type

Chr altered chromosome

Pos altered position

Ref reference base

Alt altered base

SimpleRepeat_TRF mutation locating repeat sequence

Neighborhood_sequence neighborhood sequence ...

fun_analysis *Analyzing function.*

Description

This function analyzes the filtering results.

Usage

```
fun_analysis(  
  msec,  
  mut_depth,  
  short_homology_search_length,  
  min_homology_search,  
  threshold_p,  
  threshold_hairpin_ratio,  
  threshold_short_length,  
  threshold_distant_homology,  
  threshold_soft_clip_ratio,  
  threshold_low_quality_rate,  
  homopolymer_length  
)
```

Arguments

msec	Mutation filtering information.
mut_depth	Mutation coverage data.
short_homology_search_length	Small sequence for homology search.
min_homology_search	The sequence length for homology search.
threshold_p	The largest p value of significant errors.
threshold_hairpin_ratio	The smallest hairpin read ratio.
threshold_short_length	Reads shorter than that are analyzed.
threshold_distant_homology	The smallest rate of reads from other regions.
threshold_soft_clip_ratio	The rate of soft-clipped reads.
threshold_low_quality_rate	The smallest rate of low quality bases.
homopolymer_length	The smallest length of homopolymers.

Value

msec

Examples

```
data(msec_summarized)  
data(mut_depth_checked)  
fun_analysis(msec = msec_summarized,  
             mut_depth = mut_depth_checked,
```

```

short_homology_search_length = 4,
min_homology_search = 40,
threshold_p = 10 ^ (-6),
threshold_hairpin_ratio = 0.50,
threshold_short_length = 0.75,
threshold_distant_homology = 0.15,
threshold_soft_clip_ratio = 0.50,
threshold_low_quality_rate = 0.1,
homopolymer_length = 15
)

```

fun_hairpin_check *Hairpin-structure sequence check function*

Description

This function attempts to find hairpin structure sequences.

Usage

```
fun_hairpin_check(hairpin_seq_tmp, ref_seq, hairpin_length, hair)
```

Arguments

hairpin_seq_tmp	The sequence to be checked.
ref_seq	Reference sequence around the mutation.
hairpin_length	The temporal length of hairpin sequences.
hair	The length of sequences to be checked.

Value

list(hairpin_length, whether hairpin sequences exist or not)

fun_homology *Homology check function.*

Description

This function attempts to search the homologous regions.

Usage

```
fun_homology(  
  msec,  
  df_distant,  
  min_homology_search,  
  ref_genome,  
  chr_no,  
  progress_bar  
)
```

Arguments

msec	Mutation filtering information.
df_distant	Sequences to be checked.
min_homology_search	Minimum length to define "homologous".
ref_genome	Reference genome for the data.
chr_no	Reference genome chromosome number (human=24, mouse=22).
progress_bar	"Y": You can see the progress visually.

Value

msec

Examples

```
## Not run:  
data(msec_read_checked)  
data(homology_searched)  
fun_homology(msec = msec_read_checked,  
  df_distant = homology_searched,  
  min_homology_search = 40,  
  ref_genome = BSgenome.Hsapiens.UCSC.hg38::BSgenome.Hsapiens.UCSC.hg38,  
  chr_no = 24,  
  progress_bar = "N"  
)  
  
## End(Not run)
```

fun_load_bam

BAM file loader

Description

This function attempts to load the BAM file.

Usage

```
fun_load_bam(bam_file)
```

Arguments

`bam_file` Path of the BAM file.

Value

`df_bam`

Examples

```
fun_load_bam(  
  system.file("extdata", "sample.bam", package = "MicroSEC")  
)
```

`fun_load_chr_no` *Chromosome number loading function.*

Description

This function attempts to load the chromosome number.

Usage

```
fun_load_chr_no(organism)
```

Arguments

`organism` Human or Mouse genome.

Value

`chr_no`

Examples

```
fun_load_chr_no("Human")
```

fun_load_genome *Genome loading function.*

Description

This function attempts to load the appropriate genome.

Usage

```
fun_load_genome(organism)
```

Arguments

organism Human or Mouse genome.

Value

ref_genome

Examples

```
fun_load_genome("Human")
```

fun_load_mutation *Mutation data file loader*

Description

This function attempts to load the mutation information file.

Usage

```
fun_load_mutation(  
  mutation_file,  
  sample_name,  
  ref_genome,  
  chr_no,  
  simple_repeat_list = ""  
)
```

Arguments

mutation_file Path of the mutation information file.
sample_name Sample name.
ref_genome Reference genome for the data.
chr_no Reference genome chromosome number (human=24, mouse=22).
simple_repeat_list Optional, set simple repeat bed file path.

Value

df_mutation

Examples

```
fun_load_mutation(
  system.file("extdata", "mutation_list.tsv", package = "MicroSEC"),
  "sample",
  BSgenome.Hsapiens.UCSC.hg38::BSgenome.Hsapiens.UCSC.hg38,
  24
)
```

fun_read_check	<i>Read check function.</i>
----------------	-----------------------------

Description

This function attempts to check the mutation profile in each read.

Usage

```
fun_read_check(
  df_mutation,
  df_bam,
  ref_genome,
  sample_name,
  read_length,
  adapter_1,
  adapter_2,
  short_homology_search_length,
  min_homology_search,
  progress_bar
)
```

Arguments

df_mutation	Mutation information.
df_bam	Data from the BAM file.
ref_genome	Reference genome for the data.
sample_name	Sample name (character)
read_length	The read length in the sequence.
adapter_1	The Read 1 adapter sequence of the library.
adapter_2	The Read 2 adapter sequence of the library.
short_homology_search_length	Small sequence for homology search.

```

min_homology_search      Minimum length to define "homologous".
progress_bar             "Y": You can see the progress visually.

```

Value

```
list(msec, homology_search, mut_depth)
```

Examples

```

## Not run:
data(exampleMutation)
data(exampleBam)
fun_read_check(df_mutation = exampleMutation,
df_bam = exampleBam,
ref_genome = BSgenome.Hsapiens.UCSC.hg38::BSgenome.Hsapiens.UCSC.hg38,
sample_name = "sample",
read_length = 150,
adapter_1 = "AGATCGGAAGAGCACACGTCTGAACTCCAGTCA",
adapter_2 = "AGATCGGAAGAGCGTCGTGTAGGGAAAGAGTGT",
short_homology_search_length = 4,
min_homology_search = 40,
progress_bar = "N"
)

## End(Not run)

```

```
fun_repeat_check      Repeat check function.
```

Description

This function attempts to check the repetitive sequence around the mutation.

Usage

```
fun_repeat_check(rep_a, rep_b, ref_seq, ref_width, del)
```

Arguments

```

rep_a      The shorter sequence of Ref and Alt.
rep_b      The longer sequence of Ref and Alt.
ref_seq    Reference sequence around the mutation.
ref_width  Search length for ref_seq.
del        Insertion: 0, Deletion: 1

```

Value

```
list(pre_rep_status, post_rep_status, pre_rep_short, post_rep_short, homopolymer_status)
```

fun_save	<i>Save function.</i>
----------	-----------------------

Description

This function attempts to save the filtering results.

Usage

```
fun_save(msec, output)
```

Arguments

msec	Mutation filtering information.
output	output file name (full path).

Examples

```
## Not run:  
data(msec_analyzed)  
fun_save(msec = msec_analyzed,  
         output = "./MicroSEC_test.tsv.gz"  
)  
  
## End(Not run)
```

fun_setting	<i>Mutated position search function.</i>
-------------	--

Description

This function attempts to find the mutated bases in each read.

Usage

```
fun_setting(pre, post, neighbor_seq, neighbor_length, alt_length)
```

Arguments

pre	The 5' side bases of the sequence for searching.
post	The 3' side bases of the sequence for searching.
neighbor_seq	Short reference sequence around the mutation.
neighbor_length	The length from the mutation to the ends of the short reference sequence.
alt_length	The length of altered bases.

Value

list(pre_search_length, post_search_length, peri_seq_1, peri_seq_2)

fun_summary	<i>Summarizing function.</i>
-------------	------------------------------

Description

This function summarizes the filtering results.

Usage

```
fun_summary(msec)
```

Arguments

msec Mutation filtering information.

Value

msec

Examples

```
data(msec_homology_searched)
fun_summary(msec_homology_searched)
```

fun_zero	<i>Divide function without 0/0 errors</i>
----------	---

Description

This function attempts to divide without 0/0 errors.

Usage

```
fun_zero(a, b)
```

Arguments

a, b Integers

Value

a divided by b

homology_searched *An example sequence information file.*

Description

A dataset containing the information of reads for homology search.

Usage

homology_searched

Format

A list with 7 factors, each contains 1508 variables:

sample_name sample name

Chr altered chromosome

Pos altered position

Ref reference base

Alt altered base

Direction 5' (pre) or 3' (post) sequence of the mutated base

Seq sequence for homology search ...

msec_analyzed *An example mutation file.*

Description

A dataset containing the information of eight mutations processed by the fun_homology function.

Usage

msec_analyzed

Format

A list with 37 factors, each contains 29 variables

Sample sample name

Mut_type mutation type

Chr altered chromosome

Pos altered position

Ref reference base

Alt altered base
SimpleRepeat_TRF mutation locating repeat sequence
Neighborhood_sequence neighborhood sequence
read_length read length
total_read number of mutation supporting reads
soft_clipped_read number of soft-clipped reads
flag_hairpin number of reads produced by hairpin structure
pre_support_length maximum 5'-supporting length
post_support_length maximum 3'-supporting length
short_support_length minimum supporting length
pre_farthest 5'-farthest supported base from the mutated base
post_farthest 3'-farthest supported base from the mutated base
low_quality_base_rate_under_q18 low quality base rate
low_quality_pre low quality base rate of 5'- side
low_quality_post low quality base rate of 3'- side
distant_homology_rate rate of reads derived from homologous regions
soft_clipped_rate rate of soft clipped reads
prob_filter_1 possibility of short-supporting length
prob_filter_3_pre possibility of 5'-supporting length
prob_filter_3_post possibility of 3'-supporting length
filter_1_mutation_intra_hairpin_loop filter 1
filter_2_hairpin_structure filter 2
filter_3_microhomology_induced_mutation filter 3

 msec_homology_searched

An example mutation file.

Description

A dataset containing the information of eight mutations processed by the fun_homology function.

Usage

```
msec_homology_searched
```

Format

A list with 34 factors, each contains 29 variables

Sample sample name

Mut_type mutation type

Chr altered chromosome

Pos altered position

Ref reference base

Alt altered base

SimpleRepeat_TRF mutation locating repeat sequence

Neighborhood_sequence neighborhood sequence

read_length read length

mut_type mutation type

alt_length length of the mutated bases

total_read number of mutation supporting reads

soft_clipped_read number of soft-clipped reads

flag_hairpin number of reads produced by hairpin structure

hairpin_length maximum length of palindromic sequences

pre_support_length maximum 5'-supporting length

post_support_length maximum 3'-supporting length

short_support_length minimum supporting length

pre_minimum_length minimum 5'-supporting length

post_minimum_length minimum 3'-supporting length

pre_farthest 5'-farthest supported base from the mutated base

post_farthest 3'-farthest supported base from the mutated base

low_quality_base_rate_under_q18 low quality base rate

low_quality_pre low quality base rate of 5'- side

low_quality_post low quality base rate of 3'-side
pre_rep_status 5'-repeat sequence length
post_rep_status 3'-repeat sequence length
homopolymer_status homopolymer sequence length
indel_status whether the mutation is indel or not
indel_length length of indel mutation
distant_homology number of reads derived from homologous regions
penalty_pre 5'-penalty score by the mapper
penalty_post 3'-penalty score by the mapper
caution comment ...

msec_read_checked *An example mutation file.*

Description

A dataset containing the information of eight mutations processed by the fun_read_check function.

Usage

msec_read_checked

Format

A list with 34 factors, each contains 46527 variables

Sample sample name
Mut_type mutation type
Chr altered chromosome
Pos altered position
Ref reference base
Alt altered base
SimpleRepeat_TRF mutation locating repeat sequence
Neighborhood_sequence neighborhood sequence
read_length read length
mut_type mutation type
alt_length length of the mutated bases
total_read number of mutation supporting reads
soft_clipped_read number of soft-clipped reads
flag_hairpin number of reads produced by hairpin structure
